

Uber Bookings and Revenue Analysis Project

Project Overview

This project analyzes booking and revenue data for an Uber ride service through an interactive Power BI dashboard covering booking performance, revenue, customers, and locations helping business owners make operational and commercial decisions grounded in accurate, up to date data.

that dashboard answers four core business questions:

How many rides are completed vs. lost (cancelled/incomplete), and why?

Where is revenue coming from, and how is it trending?

Who are the customers, and how do they behave?

Where and when do rides happen, and what does that mean for driver supply?

Key Analyses in the Dashboard

Area	What the Analysis Shows
Revenue	Monthly revenue, breakdown by vehicle type, by payment method, and by individual customer
Bookings	Completed vs. cancelled vs. incomplete booking rates, with performance detail per vehicle type
Customer	Payment behavior, completion/cancellation rates per customer, and a full detail table
Location & Timing	Top pickup locations by demand, and busiest time slots by day of the week

Recommendations for Business Owners

Based on the scope of analysis available in the dashboard, the following are the key practical recommendations:

1. Track the reasons behind lost bookings.

2. Focus on the top revenue sources

Direct operational and marketing decisions toward the vehicle types and payment methods that contribute the most revenue, instead of spreading effort evenly.

3. Reallocate drivers during peak demand

Use the Busy Time Slots and top pickup location data to position drivers geographically and by time of day, reducing wait times.

Conclusion

The current dashboard provides a solid foundation for tracking daily and monthly booking performance.
