

Juice Shop Sales Analysis Report

1. Project Overview

This project is an interactive, multi-page Power BI dashboard built to analyze retail sales and order transactions. The report combines transactional data with customer information and product attributes to give a 360 degree view of store performance.

The dashboard is designed for stakeholders who need to monitor sales performance against targets, understand customer purchasing behavior, and identify top performing items.

The main management value of the solution is its KPI-and-target design. It places four core measures at the center of decision-making: Customers, Orders, Total Amount, and Total Quantity. The report also includes target comparison visuals for each of these measures, allowing management to evaluate progress against planned performance after the report is refreshed in Power BI.

2. Business Objective

The goal of the dashboard is to answer three core business questions:

- (1) Is the store meeting its sales, quantity, and customer acquisition targets?
- (2) Which items and time periods drive the most revenue?
- (3) How do customer type and payment method influence purchasing patterns?
- (4) Which Preferred Items by Customers?
- (5) What is the Nutritional value for each item?

3. Key Metrics (KPIs)

- Total Amount vs. Target – overall revenue performance
- Total Quantity vs. Target – unitsold performance
- Total Orders vs. Target – order volume performance
- Total Customers vs. Target – customer acquisition/retention performance
- Breakdown by Payment Mode and Customer Type via donut charts

4. Key Insights & Business Value

The dashboard enables managers to see whether sales, order, and customer targets are being met, without needing to query raw data.

The Items page highlights which products drive the most volume over time, supporting inventory and promotional decisions, while the Details page allows analysts to drill into individual transactions for root cause investigation of anomalies.
